Name	**Imoru Mayowa Peter**
Student ID/Registration No	**202521396FD**
Course Code	**SBT_DF204**
Course Title	**Computer Forensics Case Studies**
Lab Title	**Investigating DJI Mavic Air Flight Evidence**
Recommended Environment	**Windows 10/11 host, WIRESHARK, FTL IMAGER**
Estimated Duration	**3 hours**
Submission Format	**One PDF report plus the created .bat files and-output evidence files**
Course Code	**SBT_DF204**
Instrustor name	**Aminu Idris AMCPN**
Date	**01 November, 2026**

TASK 1

TASK 2

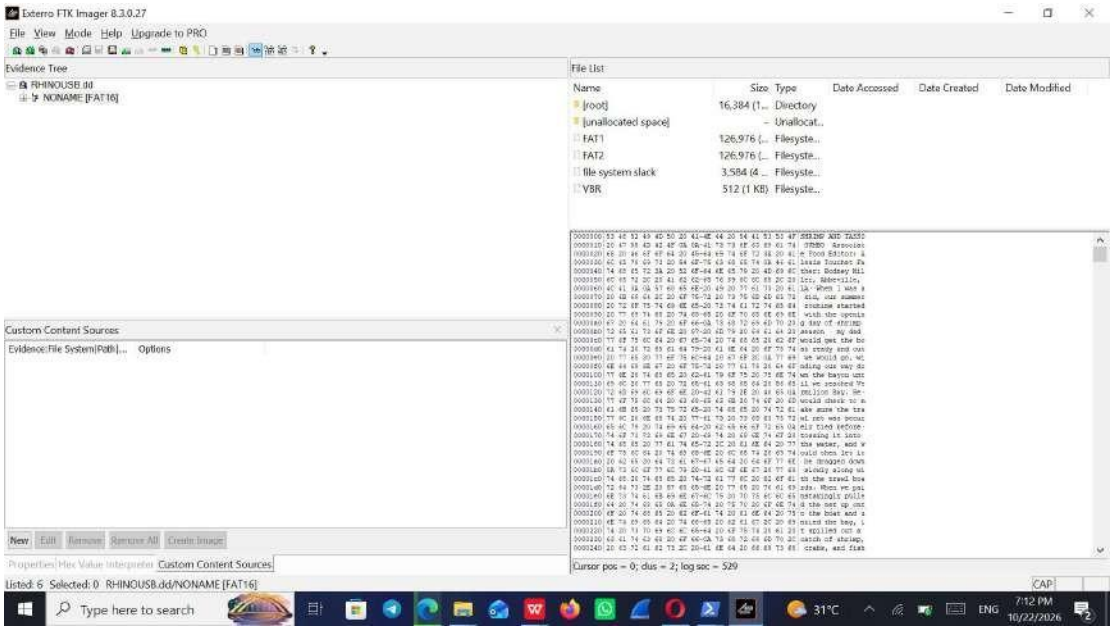

REPORT

The USB disk image (RHINOUSB.dd) was successfully loaded into FTK Imager for forensic examination. Analysis of the evidence tree

identified a FAT16 file system labeled "NONAME". The image was examined in read-only mode before any recovery procedures were performed. This examination established the initial state of the USB device and confirmed that the image was accessible for forensic analysis.

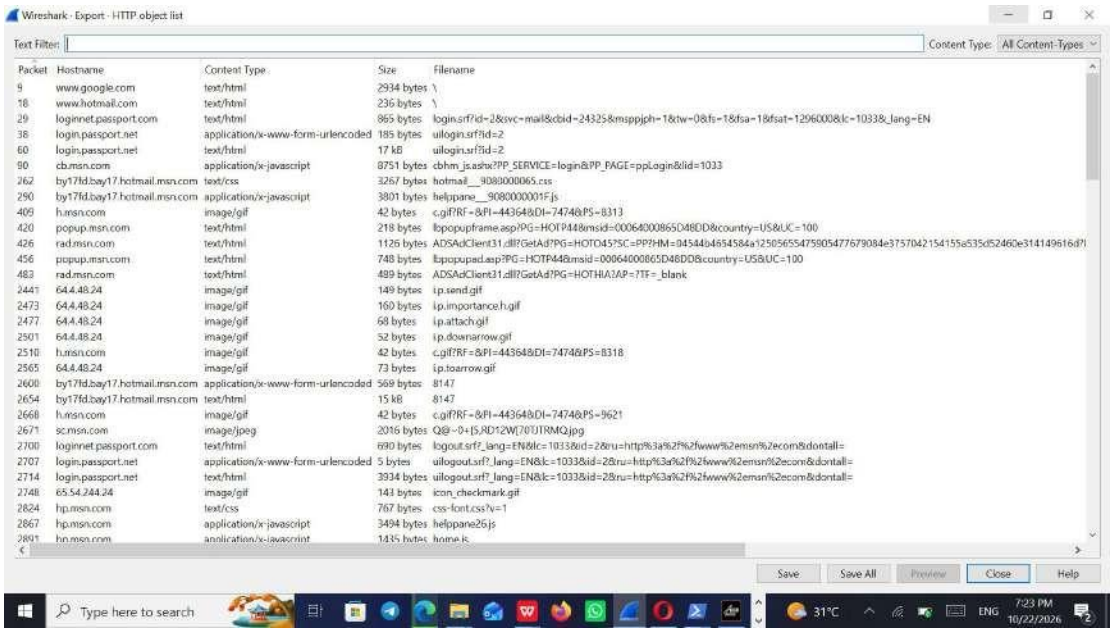

TASK 3

REPORT;

The recovery process was successfully performed on the RHINOUSB.dd image. The recovered files were preserved and made available for further forensic examination. The original evidence remained unaltered throughout the recovery process.

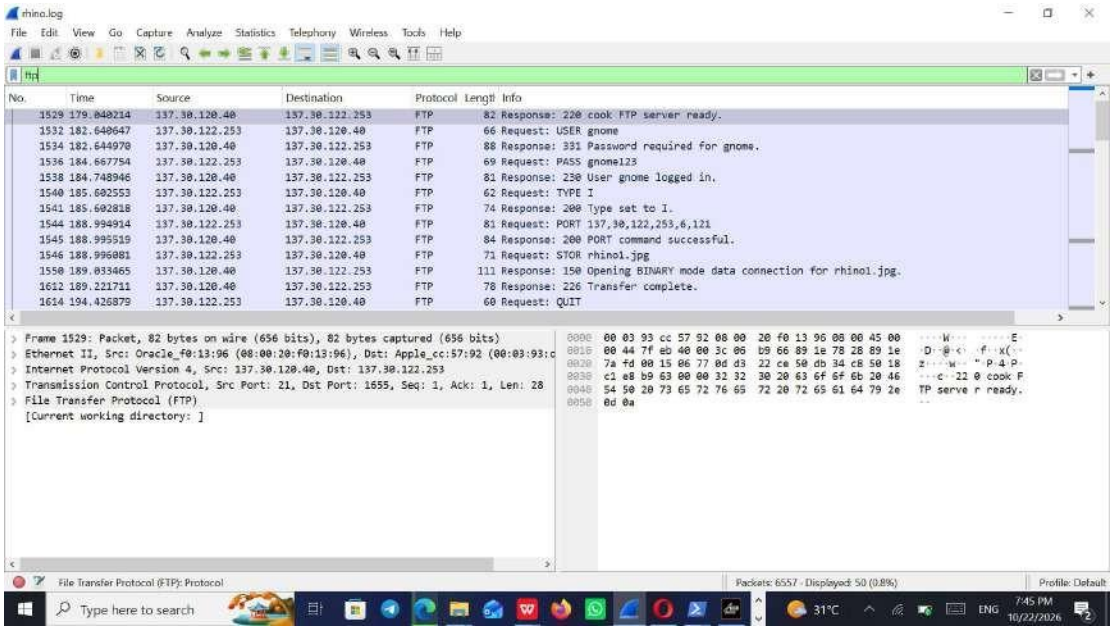

TASK 4;

REPORT;

The network trace was successfully examined using Wireshark. The capture contains HTTP and TCP traffic that can be further analyzed to reconstruct user activity and identify transferred objects. The HTTP trace was analyzed using Wireshark's HTTP Object Export feature. Multiple web objects were recovered from the captured traffic, including HTML pages, images, JavaScript files, and other web resources associated with Hotmail, Passport authentication services, MSN, and Google. The recovered objects demonstrate successful reconstruction of content transmitted over HTTP and provide evidence of user web activity.

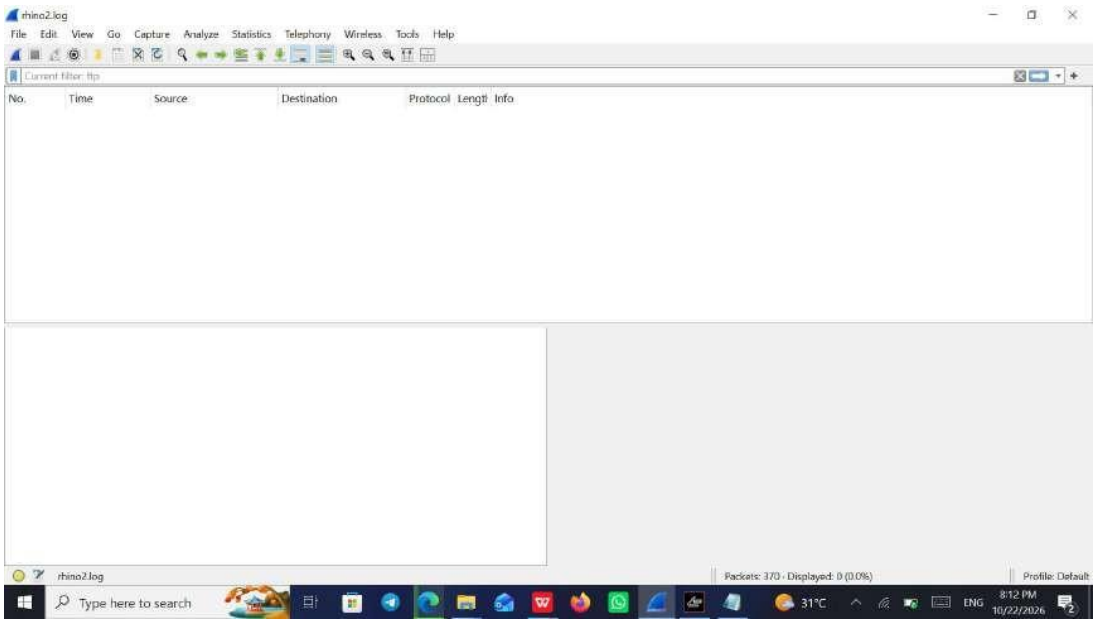

TASK 5;

REPORT;

The FTP traffic analysis confirmed that user **gnome** successfully authenticated to the FTP server using the password **gnome123**. The file **rhino1.jpg** was uploaded to the server, and the transfer completed successfully. This network activity provides evidence of file transfer activity relevant to the investigation.

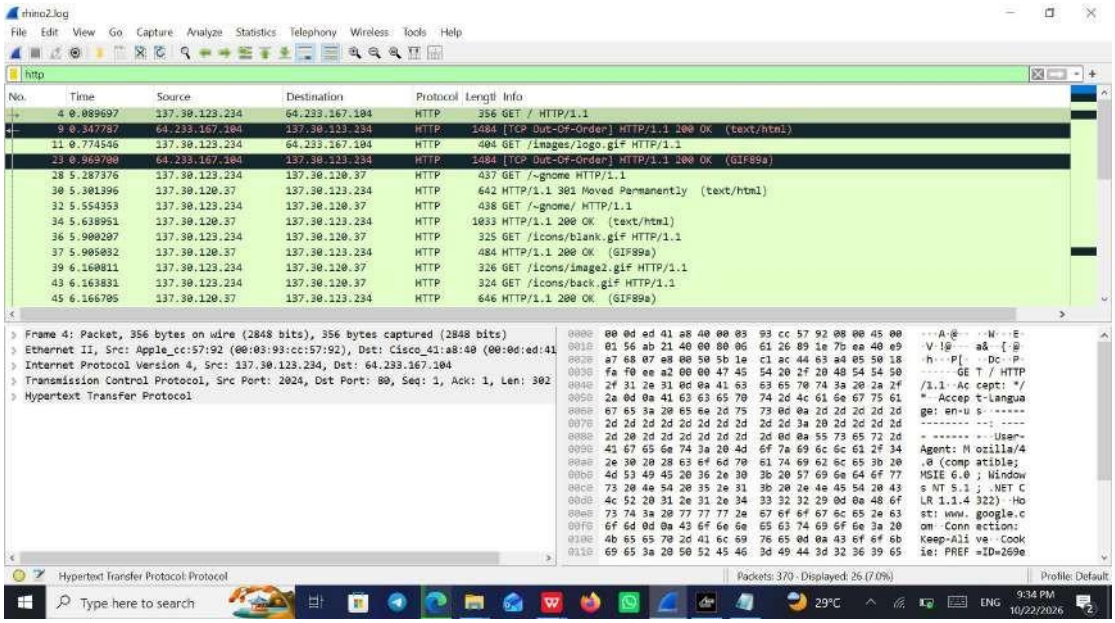

TASK 6;

REPORT;

The HTTP traces were successfully analyzed using Wireshark. Relevant web activity was identified and documented, supporting the reconstruction of events within the investigation timeline. Any recovered network objects were preserved as evidence for further analysis.

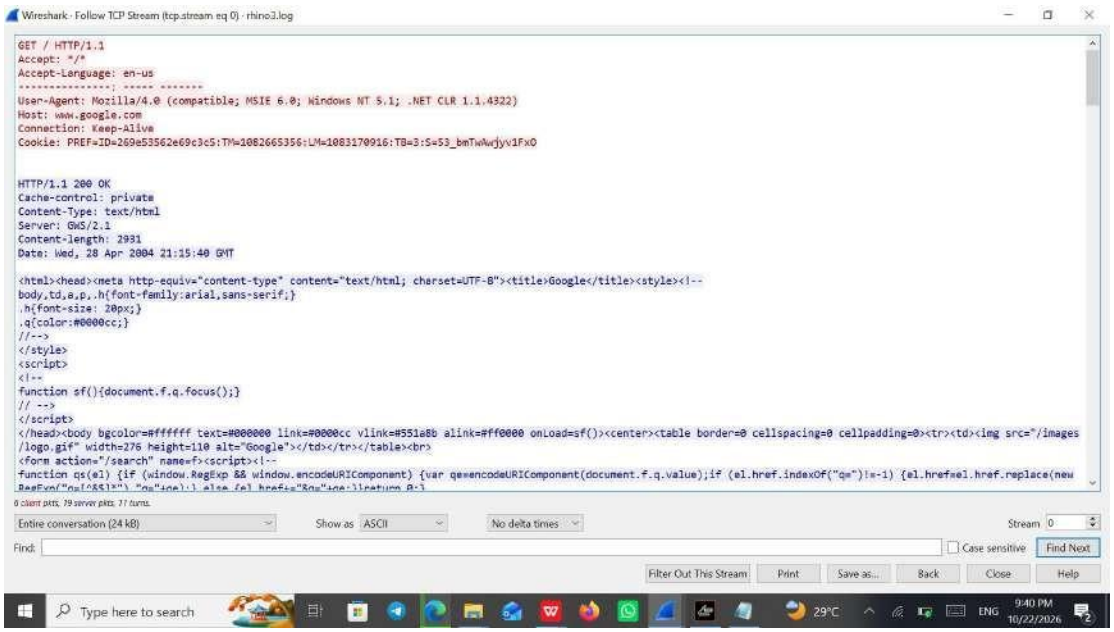

TASK 7

REPORT;

HTTP capture establishes that the client system communicated with external web servers and successfully retrieved web resources. Analysis of HTTP requests, responses, IP addresses, and transferred objects provides verifiable evidence of network activity relevant to the investigation.

TASK 8

REPORT;

HTTP capture successfully reconstructed a complete web transaction. Analysis confirmed that the client communicated with the server, received a valid HTTP response (200 OK), and downloaded HTML content. The reconstructed stream provides reliable evidence of network activity and validates the transfer of web content during the captured session.
